This invention relates to a metalloprotease with aggrecanase activity. The invention includes protein and DNA sequences of the metalloprotease, vectors containing the DNA, host cells transformed by the vectors, and antibodies directed against the metalloprotease. The antibodies, protein and DNA sequences can be used in the treatment and prevention of joint diseases, particularly osteoarthritis. The treatment may result in osteopathic and antiarthritic activity. The present sequence represents the metalloprotease of the invention termed MDTS6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GVGSKPCFYMQYCTKLWCTGKAKGQMVCQTRHFPWADGTSCGEGKLCLKGACVERHNLNK 300

The present invention relates to twenty one new human proteases, referred to as PRTS-1 to PRTS-21. The PRTS polynuclectides and polypeptides of the invention are useful in the diagnosis, treatment and prevention of gastrointestinal e.g. gastriis, esophageal carcinoma and Crohn's disease, cardiovascular e.g. atherosclearosis, hypertension and myocardial infarction, autoimmunoffilammatory e.g. acquired immunodeficiency syndrome (AIDS), allergies and osteoarthritis, cell proliferative e.g. cancer, developmental e.g. Duchenne and Becker muscular dystrophy, epithelial e.g. dermatitis, neurological e.g. epilepsy and Alzheimer's disease and reproductive e.g. infartiity and endometriosis disorders. Numerous other examples of each disorder are given in the specification. The present protein sequence represents the human protease PRTS-11 protein of the invention.
                                                                                                                                                                                                                                                                                              cardiovascular; atherosclerosis; autolimmune disorder; dermatitis; inflammatory disorder; acquired immunodeficiency syndrome; AIDS; cell proliferative disorder; developmental disorder; epilepsy; buchenne muscular dystrophy; epithelial disorder; neurological disorder; reproductive disorder; endometriosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                   Human; novel human protein; NHP; protease; biological disorder; obesity; high blood pressure; arthritis; connective tissue disorder; infertility;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is novel human protein (NHP), human protease. NHPs share structural similarity with animal proteases particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic acid encoding a human protease, useful as a hybridization for screening libraries and assessing gene expression patterns -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           113 FVSIPRYVETLVVADESMVKFHGADLEHYLLTLLATAARLYRHPSILNPINIVVVKVLLL 272

ä
and Metalloproteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also migration, inflammation and/or anglogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.

                                                                                                                                                                                                                                                                                                                                                           ADMATS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family of proteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or angiogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                         Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NKVSDKHPEYWDTAILFTRQDLCGATTCDTLGMADVGTMCDPKRSCSVIEDDGLPSAFTT 147

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is mouse metalloproteinase ADAMTS-1. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or anglogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases

metalloprotease thrombospondin (METH) proteins METH1 and METH2 respectively. METH2 have been found to be potent inhibitors of anglogenesis both in vitro and in vivo. They can be used for treating cancer and other disorders related to anglogenesis including abnormal wound healing, inflammation, rheumatoid arthritis, psoriasis, endometrial bleeding disorders, diabetic retinopathy, some forms of macula degeneration, haemandjomas, and arterial-venous malformations. They may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilisation (chemotaxis) of immune cells. The etiology of these immune deficiencies or disorders may be genetic, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated metalloprotease thrombospondin polypeptides, useful for treating hyperproliferative disorders, cancers or autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; METH1; METH2; anti-angiogenic; metalloprotease thrombospondin; cancer; diagnosis; hyperproliferative disorder; autoimmune disease; angiogenesis inhibitor; abnormal wound healing; inflammation; rheumatoid arthritis; psoriasis; endometrial bleeding disorder; diabetic retinopathy; macula degeneration; haemangioma; detection; arterial-venous malformation; immune deficiency.

The invention relates to the novel human ADAM (A Disintegrin And Metalloproteases MDTS4 (AAB73549) and MDTS5 (AAB73550). The metalloproteases can be used for the treatment of cancers and arthritis. The invention also relates to the genes encoding MDTS4 and MDTS5, vectors and host cells containing the MDTS4 or MDTS5 specific for MDTS4 or MDTS5, and antibody specific for MDTS4 or MDTS5, and methods of screening for compounds which modulate the activity of MDTS4 and/or MDTS5. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; METH1; metalloprotease; thrombospondin; anglogenesis inhibition; cancer therapy; benign tumour; ocular anglogenic disease; rheumatoid arthritis; psoriasis; wound healing; endometriosis; vasculogenesis; granulation; hypertrophic scar; nonunion fracture; scleroderma, trachoma; vascular adhesion; myocardial anglogenesis; coronary collateral; cerebral collateral; arteriovenous malformation; ischaemic limb anglogenesis; Osler Webber syndrome; plaque neovascularisation; telangiectasia; haemophiliac joint;

This represents a human integrin ligand polypeptide ITGL-TSP. ITGL-TSP polypeptides can be used in the treatment of angiogenic diseases such as cancer. cancer metastasis, chronic inflammatory disorders, rheumatoid arthritis, atherosclerosis, macular degeneration or diabetic retinopathy restenosis, Alzheimer's disease and tissue remodeling. They can be used to treat a subject in need of enhanced activity or expression of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents human Tango-71. Tango polypeptides are useful for identifying compounds which bind the polypeptide via direct binding, competition binding assays or Tango-71, -73, -74, 76 or -83-mediated signal transduction. Tango polypeptides are also useful for identifying modulating compounds by determining effect on Tango activity. Tango polypeptides and nucleic acids are useful for diagnosing diseases related to aberrant expression of Tango, and Tango polypeptides are useful for diagnosing diseases related to aberrant expression of Tango, and Tango polypeptides are useful for raising antibodies which can be used in diagnostic assays for detection of Tango, and also for generating anti-idiotype antibodies for

METH can be used for Inhibiting angiogenesis in an individual, and for treating cancer, benign tumours, an ocultar angiogenic disease, rheumatoid arthritis, psoriasis, delayed wound healing, endometriosis, vasculogenesis, granulations, hypertrophic scars, nonunion fractures, soleroderma, trachoma, vascular adhesions, myocardial angiogenesis, soleroderma, trachoma, vascular adhesions, myocardial angiogenesis, is cheemed limb angiogenesis, osler-Webber syndrome, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, thorowascularisation, telangiectasia, haemophiliac joints, angiofibroma, thorowascularisation, methods promised in birth control. METH can also be used in birth control. METH can also be used in diagnostic methods for the prognosis of cancer. The present sequence is a protein isolated in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    612

```

```
This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX04302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAX04311-X04410; amino acid sequences AAX04311-X04410; amino acid sequences AAX04311-X04410; amino acid sequences AAX04311-C04410; amino acid sequences AAX04311-C0410; and be aminorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in (see AAX04311 for described uses).

N;Alternate names: procollagen N-proteinase
C;Species: Bos primigenius taurus (cattle)
C;Date: 15-Oct.1999 #sequence_revision 15-Oct-1999 #text_change 15-Oct-1999
C;Accession: T18517
R;Codiage, A.; Nusgens, B.V.; Laplere, C.M.
Submitted to the EMBL Data Library, February 1996
A;Description: Cloning of the CDNA of the bovine procollagen I N-proteinase.
A;Reference number: 218941

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A; Title: Purification, cloning, and molecular characterization of a high molecular
                                                                                                                                    predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      jararhagin C precursor - jararaca (fragment)
NyAlternate names: single chain botrocetin
NyContains: disintegrin-like 28k protein; hemorrhagic proteinase (EC 3.4.24.-)
C;Species: Bothrops jararaca (jararaca)
C;Date: 20-Feb-1995 #sequence_revision 29-Aug-1997 #text_change 09-Jun-2000
C;Accession: S24789; JC2245; A44463; A37958; JC2373
Submitted to the EMBL Data Library, August 1992
A;Reference number: S24789
A;Accession: S24789

CELLS OF PRECOULATORY FOLLICLES.

DOMAIN: THE SPACER DOMAIN AND THE TSP TYPE-1 DOMAINS ARE IMPORTANT FOR A TIGHT INTERACTION WITH THE EXTRACELLULAR MATRIX.

PTM: THE PRECURSOR IS CLEAVED BY A FURIN ENDOPEPTIDASE.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY M12B.

SIMILARITY: CONTAINS 1 DISINTEGRIN-LIKE DOMAIN.

SIMILARITY: CONTAINS 3 TSP TYPE-1 DOMAINS.

CAUTION: REP. 2 SEQUENCE ELFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT IN POSITION 7.
                                                        SITE, WITHIN THE CHONROITIN SULFATE ATTACHMENT DOMAIN. COFACTOR: BINDS 1 ZINC ION (BY SIMILARITY). SUBCELLULAR LOCATION: SECRETED. ASSOCIATED WITH THE EXTRACELLULAR
                                                                                                                     INDUCTION: INDUCED IN VITRO IN COLON ADENOCARCINOMA CELLS BY INTERLEUKIN-1, OR IN VIVO IN KIDNEY AND HEART BY LIPOPOLYSACCHARIDE. ALSO INDUCED BY LH STIMULATION IN GRANULOSA
VARIOUS INFLAMMATORY PROCESSES AS WELL AS DEVELOPMENT OF CANCER
                                           CATALYTIC ACTIVITY: CLEAVES AGGRECAN AT THE 1691-GLU-|-LEU-1692
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (POTENTIAL).

Blum H., Bauersachs S., Mewes H.-W., Weil B., Wiemann S.;

Submitted (MAR-2000) to the EMBL/GenBank/DDBJ databases.

- FUNCTION: CLEAVES AGGRECAN, A CARTILAGE PROTEOGLYCAN, AND MAY BE INVOLVED IN ITS TURNOVER (BY SIMILARITY). HAS ANGIOGENIC INHIBITOR ACTIVITY. ACTIVE METALLOPROTEASE, WHICH MAY BE ASSOCIATED MITH VARIOUS INFLAMMATORY PROCESSES AS WELL AS DEVELOPMENT OF CANCER CACHEXIA. MAY PLAY A CRITICAL ROLE IN FOLLICULAR RUPTURE.

- CATALTIC ACTIVITY: CLEAVES AGGRECAN AT THE 1938-GLU-1-LEU-1939

SITE, WITHIN THE CHONDROITIN SULFATE ATTACHMENT DOMAIN.

-- COPACTOR: BINDS 1 ZINC ION (BY SIMILARITY).

-- SUBCELLUIAR LOCATION: Secreted. Associated with the extracellular

-1. SUBCELLULAR LOCATION: Secreted. Associated with the extracellular matrix (By similarity).

-1. TISSUE SPECIFICITY: EXPRESSED IN BRAIN, LUNG AND HEART. EXPRESSED AT VERY LOW LEVEL. IN PLACENTA AND SKELETAL MUSCLES.

-1. INDUCTION: BY INTERLEUKIN.1.

-1. DOMAIN: THE SPACER DOMAIN AND THE TSP TYPE-1 DOMAINS ARE IMPORTANT FOR A TIGHT INTERACTION WITH THE EXTRACELLULAR MATRIX.

-1. PTM: THE PRECURSOR IS CLEAVED BY A FURIN ENDOPEPTIDASE.

-1. SIMILARITY: ENLONGS TO PEPPIDASE FAMILY M12B.

-1. SIMILARITY: CONTAINS 1 DISINTEGRIN.LIKE DOMAIN.

-1. SIMILARITY: CONTAINS 1 TYPE-1 DOMAIN.

-1. SIMILARITY: CONTAINS 1 TYPE-1 DOMAIN.

-1. CAUTION: HAS SOMETIMES BEEN REFERRED TO AS ADAMTS2.
